Dear Hiring Manager,

I am excited to apply for a Full Stack Software Engineer position at your organization. With a Master's degree in Computer Science and hands-on experience building scalable web applications, cloud-hosted services, and performance-optimized systems, I bring a strong foundation in both frontend and backend engineering.

In my recent role as a Full Stack Developer – Data Platform UI at JPMorgan Chase, I built React and TypeScript interfaces that rendered large financial datasets with consistent performance. I also architected REST APIs, implemented authentication and validation middleware, and optimized complex SQL queries to reduce dashboard load times by 35%.

Currently, at Sikhi Solutions, I deliver full-stack features using React, Spring Boot, and REST APIs while building reusable UI components and automating backend workflows. My work has focused on improving API performance, enhancing system reliability, and reducing manual processing through scripting and scheduled jobs.

Earlier, as a Software Analyst, I optimized API request handling, designed event-driven integrations, and modernized legacy modules to improve throughput, stability, and reporting accuracy.

My technical toolkit includes React, TypeScript, Java, Spring Boot, Node.js, SQL, AWS, and CI/CD practices. I enjoy building scalable systems, optimizing performance, and delivering production-ready features in Agile environments.

I would welcome the opportunity to contribute my full-stack engineering skills and problem-solving approach to your team. Thank you for your time and consideration.

Sincerely,
Chaitanya Ratnaparkhi
